Check Tutorial tab to know how to to solve.

Here is a sample line of code that can be executed in Python:

```
print("Hello, World!")
```

You can just as easily store a string as a variable and then print it to stdout:

```
my_string = "Hello, World!"
print(my_string)
```

The above code will print `Hello, World!` on your screen. Try it yourself in the editor below!

Input Format

You do not need to read any input in this challenge.

Output Format

Print `Hello, World!` to stdout.

Sample Output 0

```
Hello, World!
```

Change Theme Language Pypy 3

```
if __name__ == '__main__':
    print("Hello, World!")

```

Check Tutorial tab to know how to to solve.

Task

The provided code stub reads two integers from STDIN, a and b. Add code to print three lines where:

1. The first line contains the sum of the two numbers.
2. The second line contains the difference of the two numbers (first - second).
3. The third line contains the product of the two numbers.

Example

$a = 3$

$b = 5$

Print the following:

```
8
-2
15
```

Input Format

The first line contains the first integer, a.

The second line contains the second integer, b.

Constraints

$1 \leq a \leq 10^{10}$

$1 \leq b \leq 10^{10}$

Change Theme Language Pypy 3

```python
if __name__ == '__main__':
    a = int(input())
    b = int(input())
    print(a+b)
    print(a-b)
    print(a*b)

```

Check the Tutorial tab to know learn about division operators.

Task

The provided code stub reads two integers, a and b, from STDIN.

Add logic to print two lines. The first line should contain the result of integer division, a // b. The second line should contain the result of float division, a / b.

No rounding or formatting is necessary.

Example

$a = 3$

$b = 5$

- The result of the integer division $3//5 = 0$.
- The result of the float division is $3/5 = 0.6$.

Print:

```
0
0.6
```

Input Format

The first line contains the first integer, a.

The second line contains the second integer, b.

Output Format

Print the two lines as described above.

Sample Input 0

Change Theme Language Pypy 3

```python
if __name__ == '__main__':
    a = int(input())
    b = int(input())
    print(a//b)
    print(a/b)

```

Task

The provided code stub reads an integer, n, from STDIN. For all non-negative integers $i < n$, print i^2.

Example

$n = 3$

The list of non-negative integers that are less than $n = 3$ is $[0, 1, 2]$. Print the square of each number on a separate line.

```
0
1
4
```

Input Format

The first and only line contains the integer, n.

Constraints

$1 \leq n \leq 20$

Output Format

Print n lines, one corresponding to each i.

Sample Input 0

Change Theme Language Pypy 3

```python
if __name__ == '__main__':
    n = int(input())
    list=[]
    while n>0 :
        n=n-1
        list.append(n)
    i=len(list)
    while i>0:
        i-=1
        print(list[i]**2)

```

The included code stub will read an integer, n, from STDIN.

Without using any string methods, try to print the following:

$123 \cdots n$

Note that "..." represents the consecutive values in between.

Example

$n = 5$

Print the string 12345.

Input Format

The first line contains an integer n.

Constraints

$1 \leq n \leq 150$

Output Format

Print the list of integers from 1 through n as a string, without spaces.

Sample Input 0

```
3
```

Sample Output 0

Change Theme Language Pypy 3
